

Highlights

Network-based prioritization of venom–host interactions potentially relevant to Russell’s viper–associated thrombotic microangiopathy

- Multi-layer network-toxicology pipeline from Daboia venom toxins to TMA machinery
- Coagulation/platelet axis dominates target, network, and enrichment evidence
- Seven toxin–host complexes cross-checked on three docking platforms plus NMA
- Batimastat, marimastat and varespladib bind toxin pockets with sound geometry
- Cross-species transcriptomes and AOP mapping bound the mechanism honestly
